

# The Weather Never sleeps

---

This month's article "The weather Never Sleeps" focuses on the need of a proper winter preflight. Here at OU some of the issues of winter preflight are not giving a second thought because we are fortunate to have hangars to put our airplanes in nightly, but what about when we are off station? It can take as little as 5-15 minutes for frost to form up while you are paying for fuel or using the bathroom on a cross country on a clear cold night. When you come back out you have to ask yourself "what do I do if my wing is contaminated". As you will read there are consequences to failing to question your winter preflight procedures.

The Weather Never sleeps, by ROBERT N. ROSSIER.
